

## Truss Jibs

Truss Jib - Truss jib's could actually be utilized in order to carry, transport and position trusses. The additional part is designed to work as an extended jib attachment along with a pyramid or triangular shaped frame. Normally, truss jibs are mounted on equipment like for example a skid steer loader, a compact telehandler or even a forklift making use of a quick-coupler accessory.

Older style cranes which have deep triangular truss jibs are normally assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Each and every bolted or riveted joint is prone to corrosion and therefore requires frequent upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This design can cause narrow separation between the flat surfaces of the lacings. There is little room and limited access to clean and preserve them against rusting. A lot of bolts become loose and corrode in their bores and should be changed.
