

Extension Booms for Forklift

Forklift Extension Boom - Normally, we think of forklifts as machines intended for transporting and picking up pallets. There are extensions accessible to give the lift truck more length and more strength for heavier loads. By using one of the four main lift truck booms, your forklift could be helpful for different other functions. The four main forklift booms are the coil boom, the pipe boom, the shooting boom and the carpet boom. Each of these are designed for attachment onto your forklift.

Coil Poles

Able to attach to the forklift's carriage, coil poles are built to transport rolled coils and other rolled materials such as reels of wire or concrete poles. Coil poles will enable you to move any rolled or cylinder material as well.

Carpet Poles

Carpet poles are designed to mount directly to the forklifts' carriage and are made from EN24T steel. They are referred to as carpet poles but are likewise used to transfer other sorts of rolled floor coverings along with cylinder products. They don't have the ability to lift very heavy stuff like for example concrete pipes or coil poles.

Telehandlers or Shooting Forklift Booms

Shooting forklift booms could also be known as telehandlers or telescopic booms and are specifically helpful on rough terrains. This kind of boom can raise employees to heights of 20-40 feet. These booms are typically used outside on construction sites or within the agricultural industry.

Booms Should Not Be Used On Pipes

When utilizing the interior of whichever type of boom so as to transfer pipe can cause extreme damage. A hauling sling should be used instead of a pipe boom in this situation. Occasionally, cylinder shaped pipes and steel pipes must be transported utilizing a boom whenever a lifting sling is unavailable. In these instances, care should be taken to ensure the pipes internal integrity.

Additional Types

Two additional booms could be utilized together with your forklift; the clear view boom and the low profile boom. Neither of these booms connects to the carriage but in its place connects to the forklifts' blades. They allow an easy transition from pallet to rolled or coiled objects with the additional benefit of offering a clear line of sight for the individual operating it.

Guidance for Safety

Forklift operators need to complete a training course in order to learn how to drive the machinery in the most practical and safe manner. This training is intended to keep the individual operating it safe and to prevent any injury to those working in the vicinity. Forklifts are a heavy piece of industrialized equipment and considered to be a possibly dangerous machine. Those who work with and around them must comply with and comprehend all of the safety measures.

Additional training should be provided to individuals who will be working with lift truck booms. This would make sure they know how to carefully work the booms. Accidents have occurred on the job from failure to safely operate a boom. A number of manufacturers provide training courses on the various types of booms and several offer on-site education where workers can be trained directly where they would be working. This on-hand training enables the trainer a chance to deal with all safety concerns at that particular job location.
