

Swing Carriage

Swing Carriages - The maximum load capacity intended for forklift jibs in both the retracted or extended positions range beginning from 1935 pounds up to 6000 lbs. It's a good idea to ask a material handling specialist about the limits for your specific application. The load capacity rankings are really meant for the jib itself and not the lift truck or the utmost load which could be lifted safely making use of a certain forklift. It is important to keep in mind that whenever whichever accessories such as a forklift jib are fitted to the lift truck, the new center of gravity made by the attachment would decrease the general lift capacity of the forklift. There are directions obtainable that offer information on the way to correctly calculate these load limits.

Prior to using any lift truck jib, make sure that the shackles and hooks are correctly secured to the lift truck. Make sure and even double check that the pins are tight. It is very important that the load calculations are correctly made and double checked. Keep in mind to consider the fact that rated capacities at times lessen when the boom is in a raised position, each time the boom is fully extended with telehandlers or even every time the mast is slanted forward.

Vital suggestions when using an adjustable jib is to never pull a load using this particular kind of accessory. These types of additions are actually just designed for vertical lifting. Also, avoid letting the load move backward and forward. Utilize extreme caution each time a load is lifted to be able to avoid tipping over the truck.
