

Forklift Fork Positioner

Fork Positioner for Forklift - A fork positioner is actually an apparatus constructed out of top quality materials designed to be able to withstand the most demanding procedures and work environments. This particular piece of equipment can enable drivers to maneuver the forks hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the entire load or the arms in order to facilitate much more accurate carrying and placement in a quicker and more effective method.

The blade pocket is rather unique and can enable the person operating it to be able to securely sway the forks into position without any worry of damaging the positioning cylinders. This could allow the operator the option to be able to execute simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be converted into blade positioners on available units.
